1 Introduction

This Jupyter notebook (Oscillation.ipynb) contains the code used to generate the following examples for the paper “Analysis of Biochemical Oscillators Using Bond Graphs and Linear Control Theory” by Peter Gawthrop and Michael Pan:

- 3. Illustrative Example (system Toy)
- 4. The Sel’kov Oscillator (system Selkov)

The example - 5. The Repressilator is in the notebook Repressilator.ipynb

1.1 Select system to be analysed

```
[1]: ## Select system to be analysed
    ## NB Repressilator example is in a separate notebook: ↗
    ## ↗Repressilator, Repressilator.ipynb
    SystemName = 'Toy'
    ToyVersion = 'basic'
    # ToyVersion = 'varyAct'
    # ToyVersion = 'varyR'

    # SystemName = 'Toycc'
    # SystemName = 'Toy1'

    # SystemName = 'ToyTwo'
    # SystemName = 'ToyTwo3'
    # SystemName = 'ToyTwo4'

    # SystemName = 'Goodwin'

    # SystemName = 'Selkov'
    # SelkovVersion = 'basic'
    # # SelkovVersion = 'varyATP'
    # SelkovVersion = 'varyR'
    # SystemName = 'Selkov1'
    # SystemName = 'Selkov3'
```

```
[2]: if SystemName in ['Toy']:
    if ToyVersion in ['basic']:
        K_Act = 1
        kappa_rf = 10
        SysName = 'Toy'
    elif ToyVersion in ['varyAct']:
        K_Act = 0.2
        kappa_rf = 10
        SysName = 'Toymod'
    elif ToyVersion in ['varyR']:
        K_Act = 1
        kappa_rf = 25
        SysName = 'ToymodR'
    else:
        print('ToyVersion', ToyVersion, 'not known.')
```

```

        print('K_Act=', K_Act)
elif SystemName in ['Selkov']:
    if SelkovVersion in ['basic']:
        v_ATP = 0.6
        kappa_rf = 10
        SysName = 'Selkov'
    elif SelkovVersion in ['varyATP']:
        v_ATP = 0.7
        kappa_rf = 10

1.2 Import some python code

The bond graph analysis uses a number of Python modules:

```

[4]: ## For path etc: sys.path
import sys
sys.path.append("/home/peterg/WORK/Research/SystemsBiology/lib/python")

```

```

[5]: ## Some useful imports
import BondGraphTools as bgt
import numpy as np
import sympy as sym

```

```

import scipy.optimize as opt
import scipy.integrate as integrate
import matplotlib.pyplot as plt
from cycler import cycler
import IPython.display as disp
import copy

## Stoichiometric analysis
import stoich as st

## SVG bg representation conversion
import svgBondGraph as sbg

## Modularity
import modularBondGraph as mbg

## Control systems package
import control as con
con.config.defaults['xferfcn.display_format'] = 'zpk'
import slycot

## Stoichiometry to BG
import stoichBondGraph as stbg

## Set slycot=True if slycot is installed (see control module)
slycot=False

## For reimporting: use imp.reload(module)
import importlib as imp

# Allow output from within functions
from IPython.core.interactiveshell import InteractiveShell
InteractiveShell.ast_node_interactivity = "all"

## Saving data
import pickle

## Set quiet=False for verbose output
quiet = True

## Plot figure to folder Figs
Plotting = False

```

```

4.1 Derive linear closed-loop response

- the closed-loop system is derived from the open loop system $L(s)$
- the input corresponds to an additive input to the product input f_P .
 - this is equivalent to the integrator $1/s$ in the forward path and $L_0(s)$ in the feedback path
 - the `feedback()` function from the control toolbox is used.
 - a unit impulse on this input is equivalent to a unit perturbation in the *initial* product state $x_P(0)$.

```
[45]: ## Simple integrator 1/s
Integrator = con.tf(1,[1,0])

## Full model
```

```

6 Closed-loop analysis

- The linearised closed-loop system is obtained by linearising the non-linear system from the bond graph
- the transfer function is from the activation (Act) to the product (P)
- the transfer function is compared with that deduced from the loop gain $L(s)$
 - the denominators are the same
 - the numerators are different as the inputs are different

```
